

The microbiomes of engineered water environments

Rose Kantor, Ph.D.

Assistant Research Engineer

Civil and Environmental Engineering, UC Berkeley

JBIMS Symposium: Microbiomes in a Changing Planet, Nov 3, 2023

What does the **Changing Planet** mean for **water**?

- Drought
- Flooding
- Warming
- Demand changes
- Pollution

- Strain on aging infrastructure
- Human and environmental health impacts
- Economic impacts

Changes affect interconnected engineered water environments

Raskin and Nielsen (2019)

Changes affect **interconnected engineered water environments**

1. Advanced water treatment

Raskin and Nielsen (2019)

Changes affect **interconnected engineered water environments**

1. Advanced water treatment

2. Direct Potable Reuse

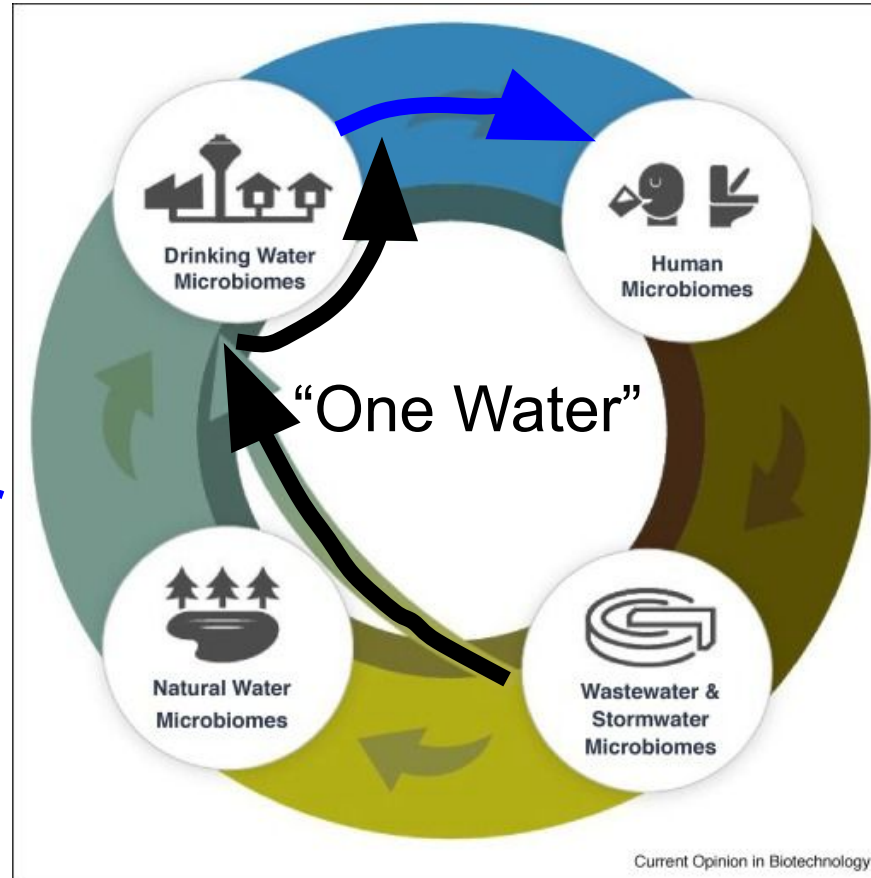

Raskin and Nielsen (2019)

Changes affect **interconnected engineered water environments**

1. Advanced water treatment

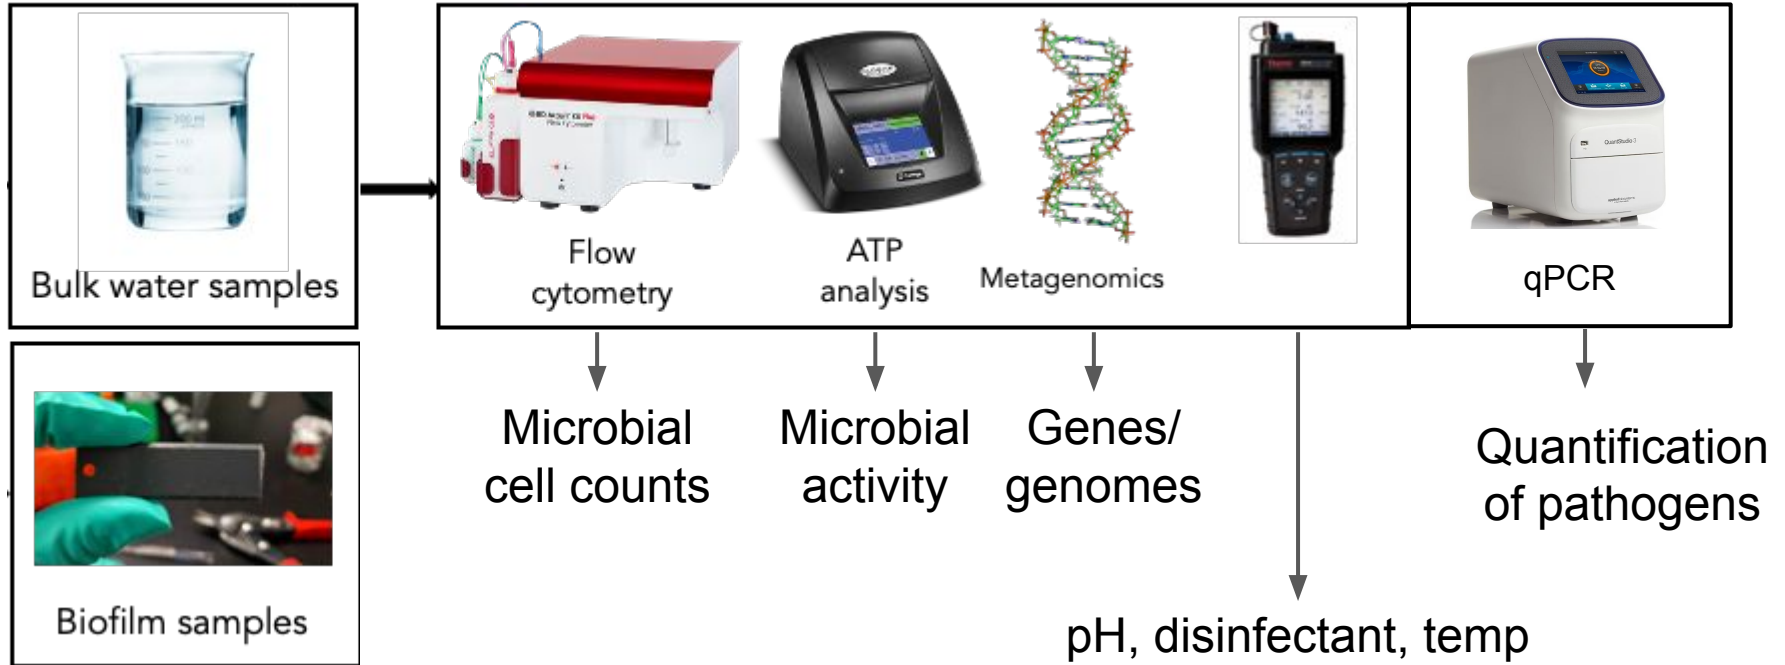

2. Direct Potable Reuse

3. Drinking water distribution system

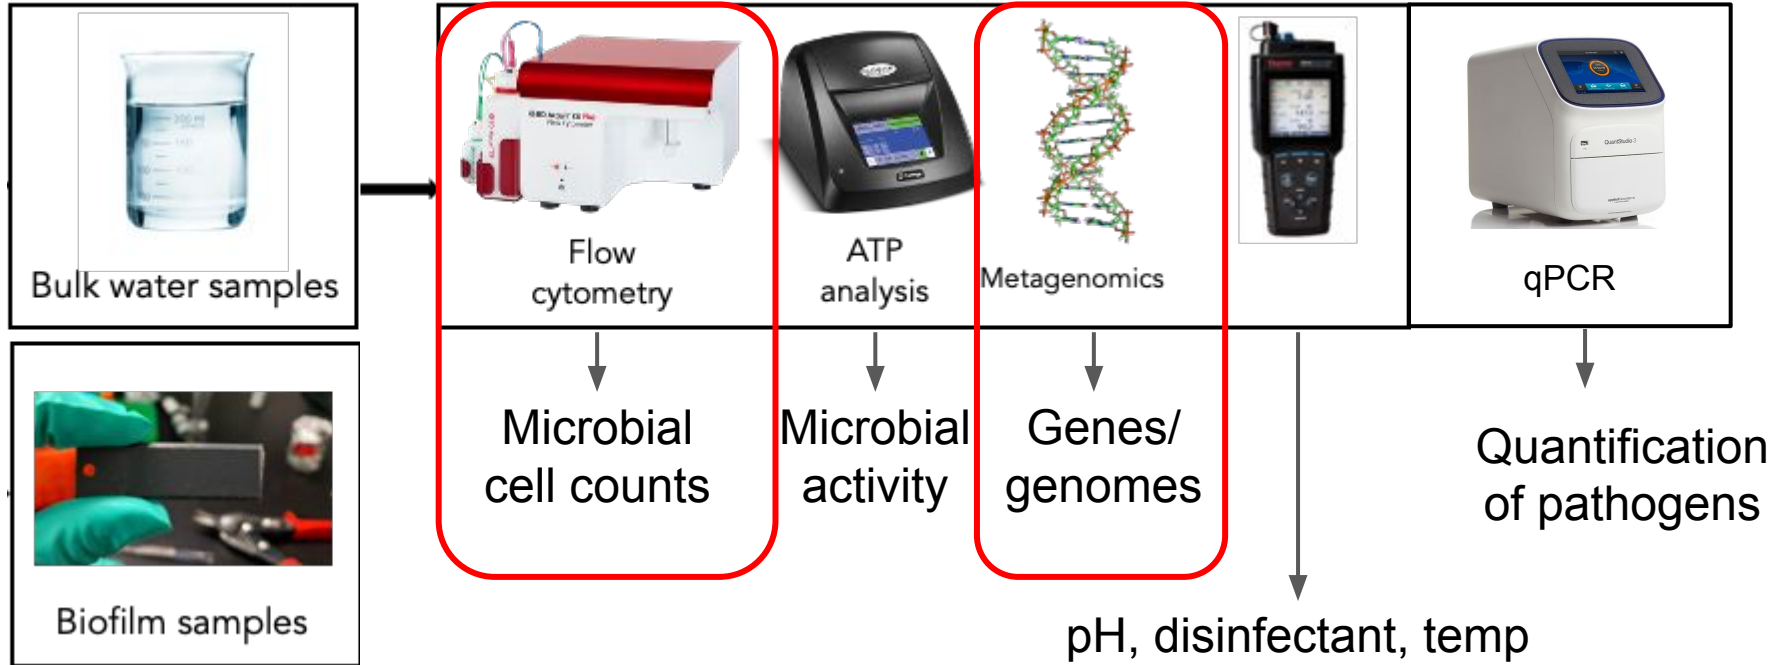

Raskin and Nielsen (2019)

Observing impacts on water microbiomes

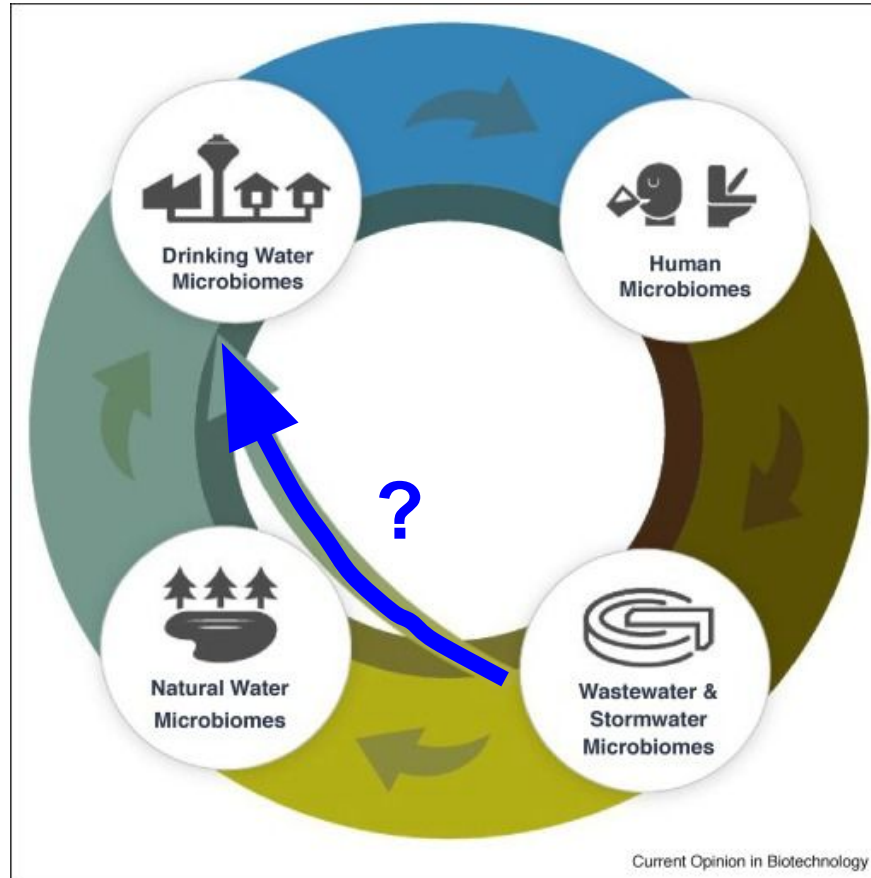

Observing impacts on water microbiomes

How do changes in water systems affect microbial communities?

1. Advanced water treatment

Raskin and Nielsen (2019)

Advanced Water Treatment Plant

Potable reuse treatment train

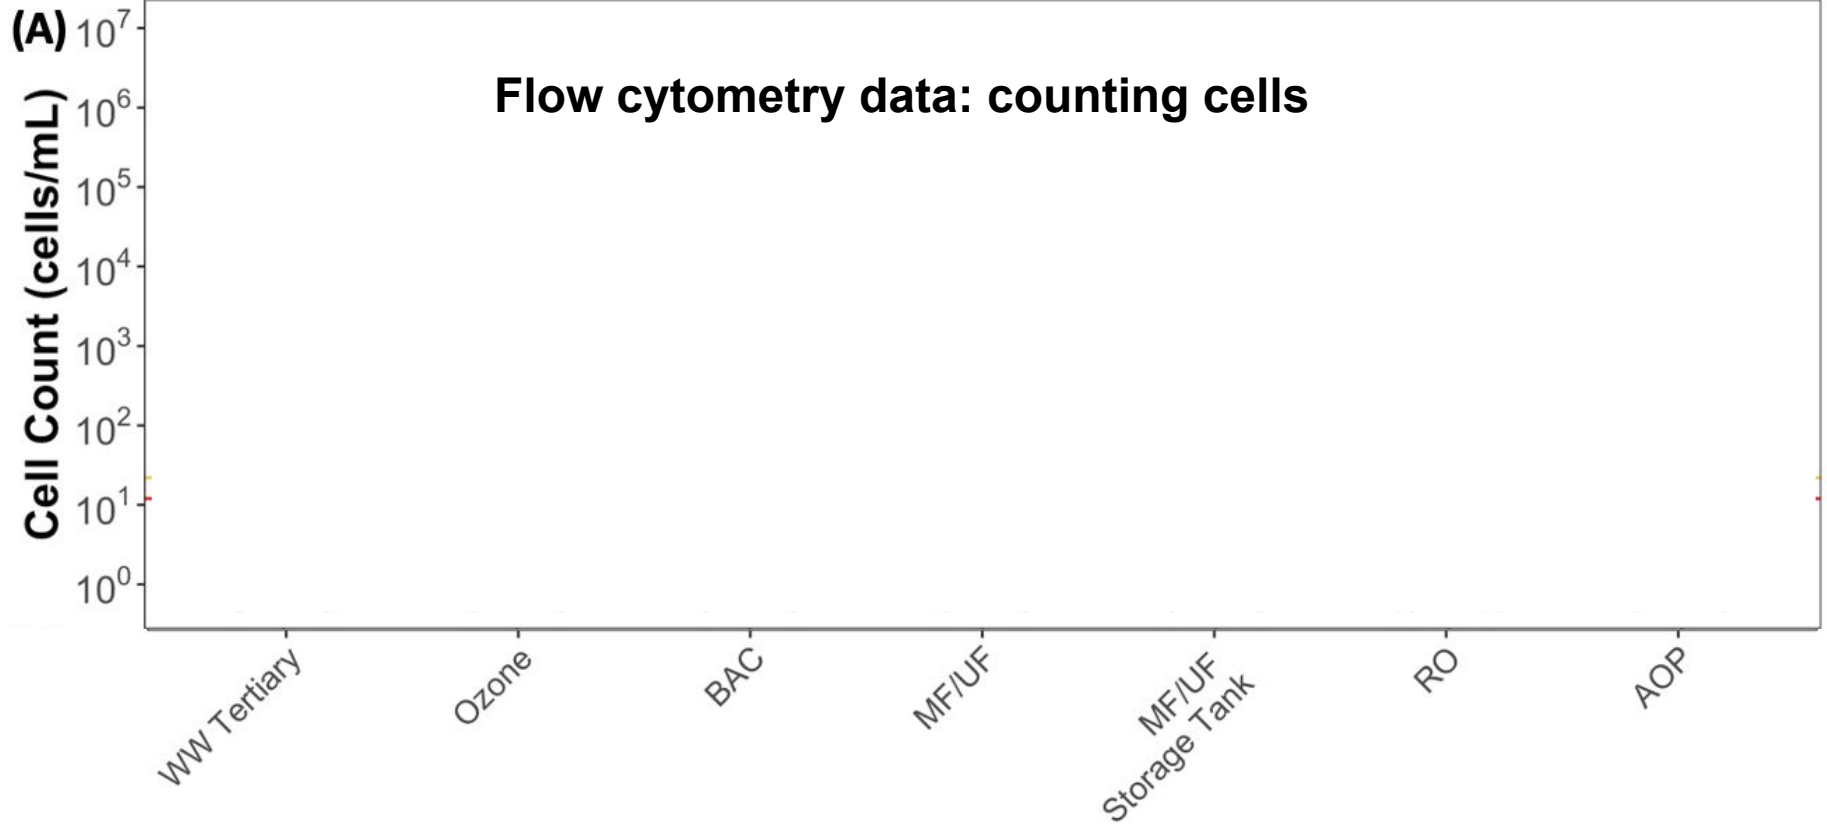

↑
 O_3 + activated carbon
remove organic matter

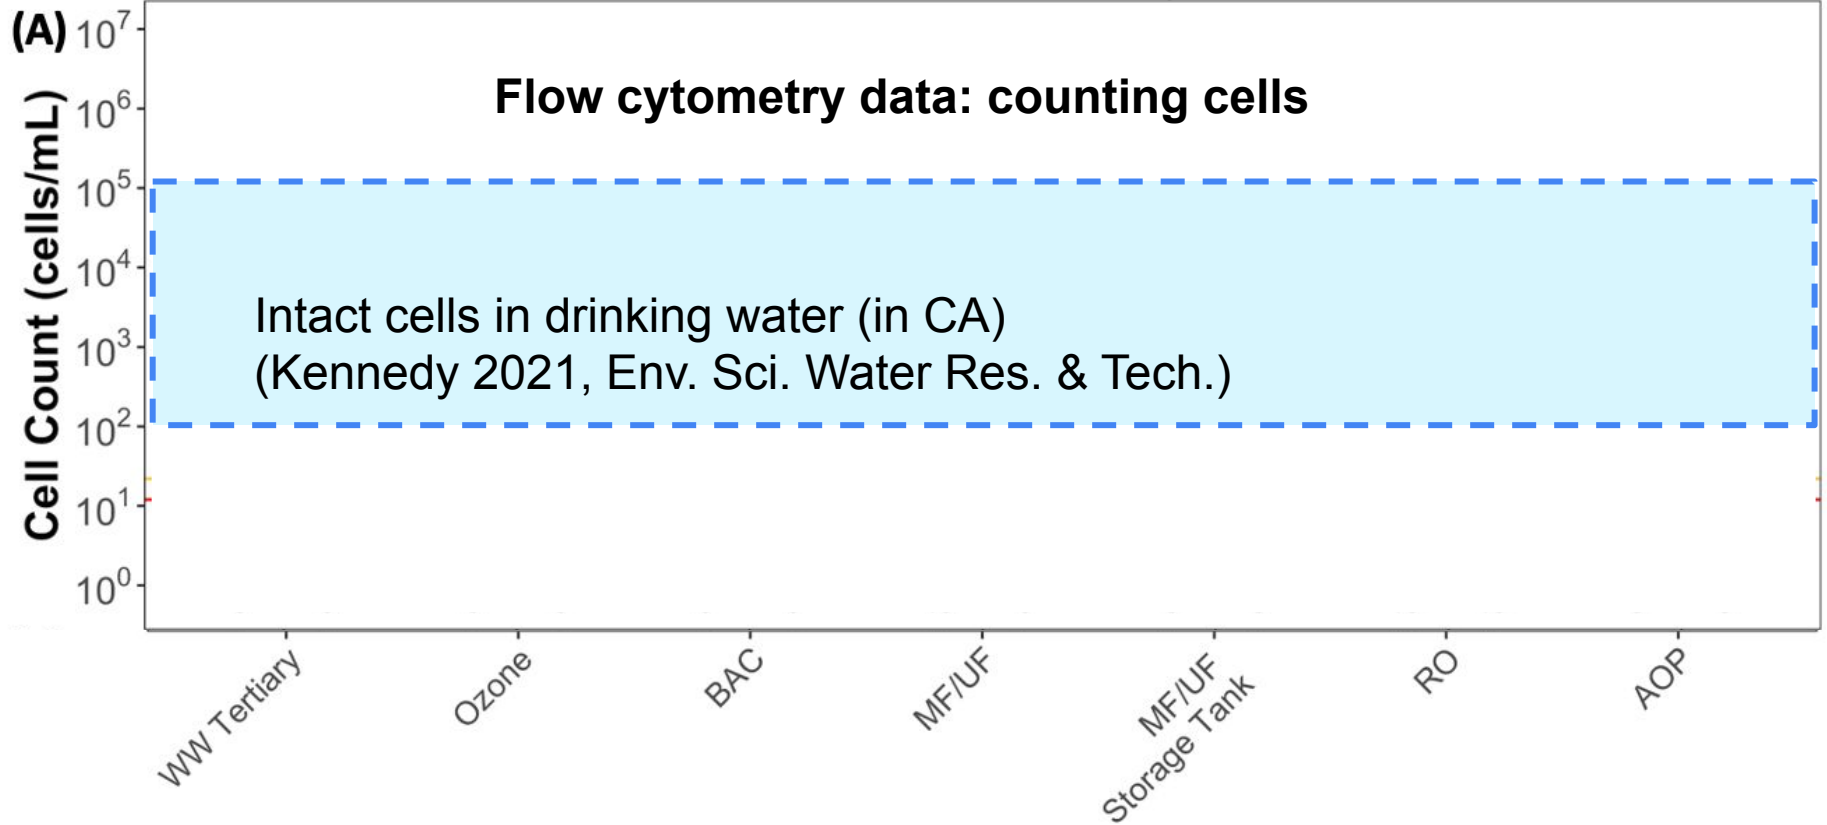

↑
Membrane
Filters

↑
UV + oxidant

Advanced treatment removes microorganisms from water

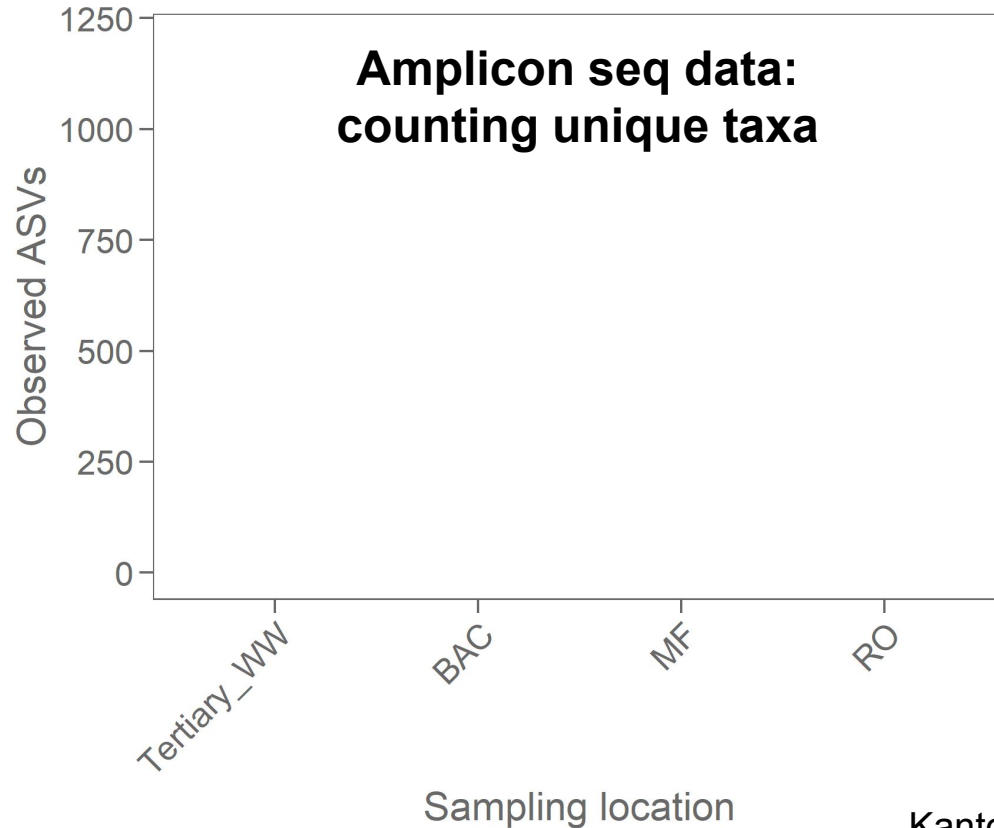

Advanced treatment removes microorganisms from water

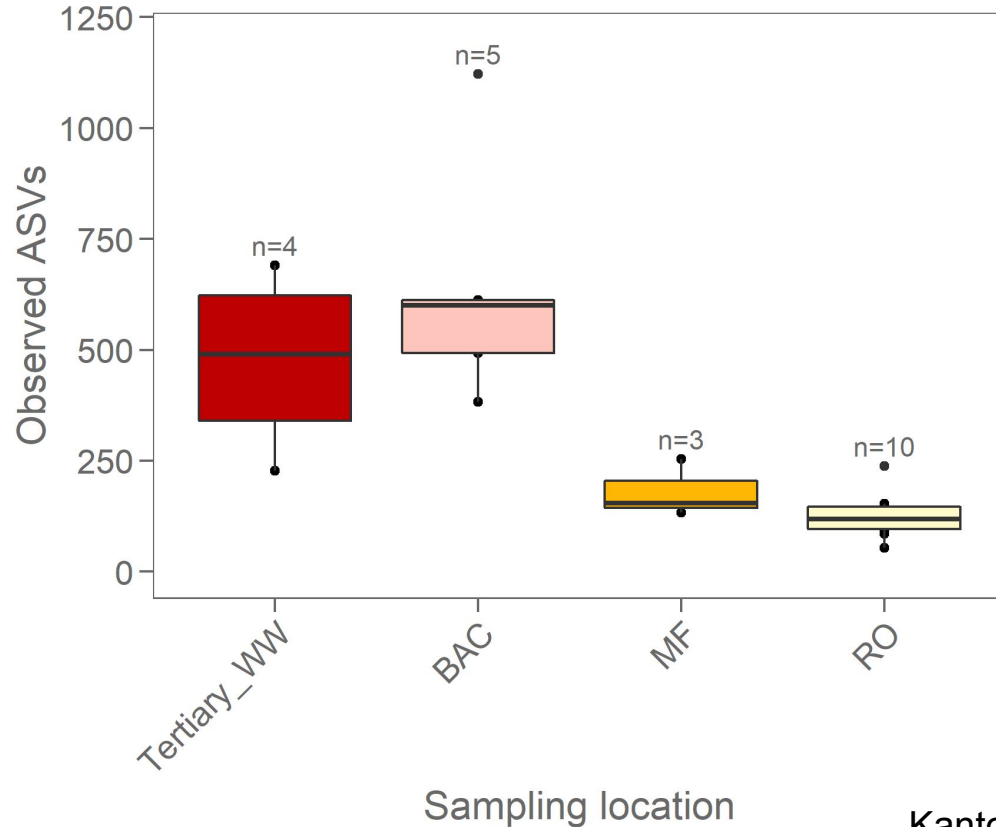

Advanced treatment removes microorganisms from water

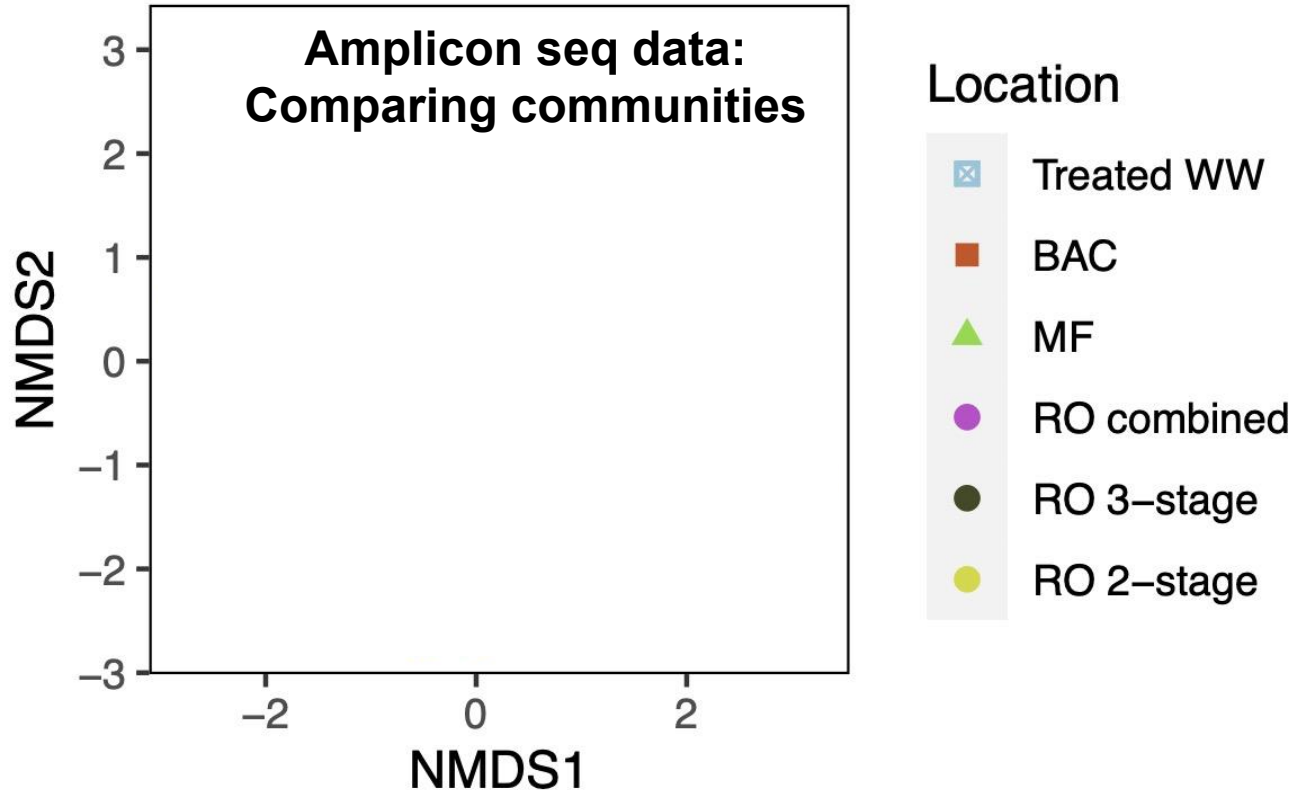

Advanced treatment affects the microbial **richness** of water

Advanced treatment affects the microbial **richness** of water

Advanced treatment affects the microbial **profile** of water

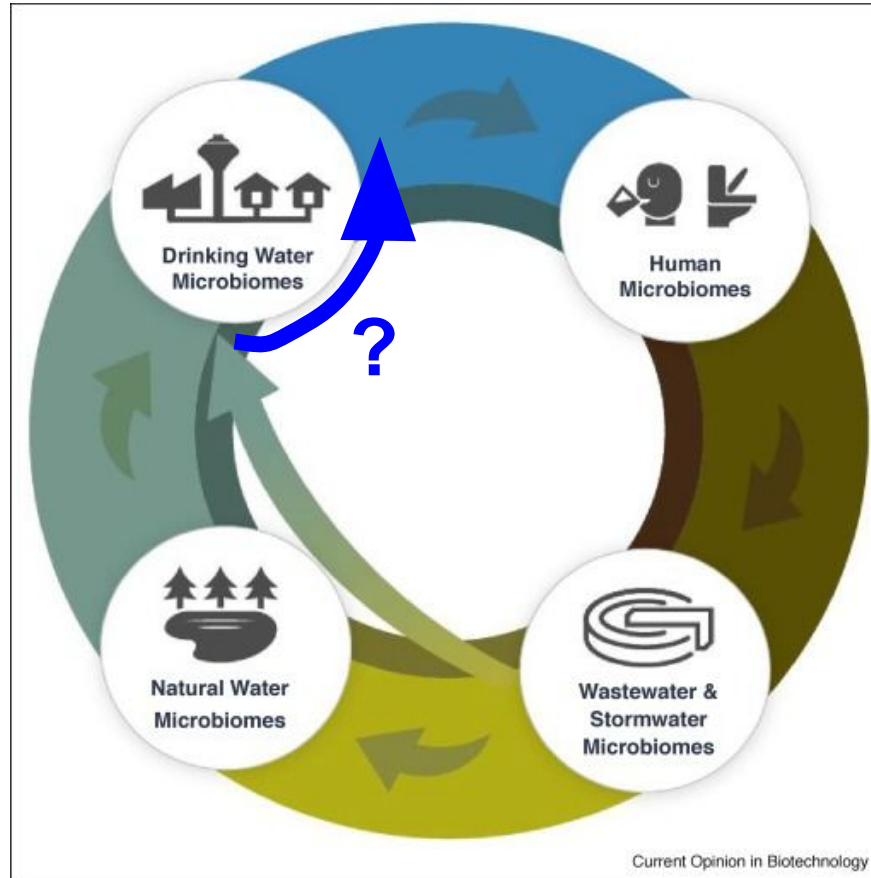

Advanced treatment affects the microbial **profile** of water

How do changes in water systems affect microbial communities?

2. Direct Potable Reuse

Raskin and Nielsen (2019)

Drinking water distribution systems are complex, not sterile

Image by Hannah Healy

What happens when we add highly purified water with lower nutrients and fewer cells?

Drinking water distribution systems are complex, not sterile

Image by Hannah Healy

Pipe loops as a model system to study direct potable reuse

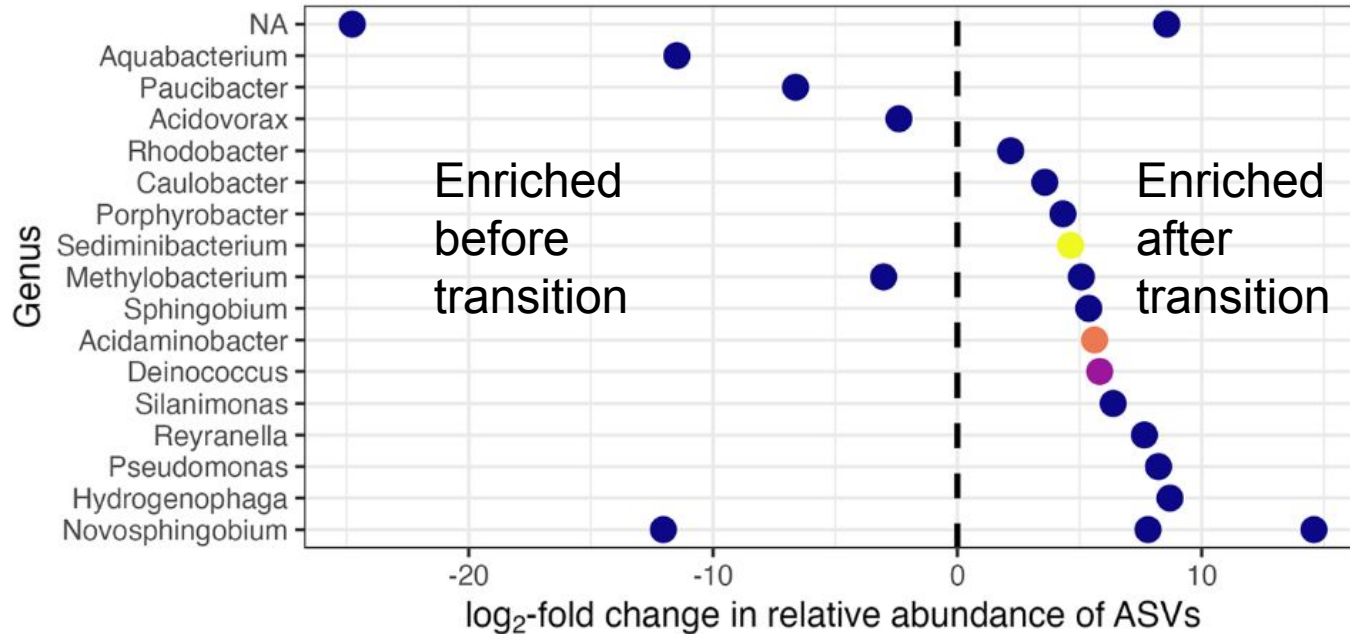

Introduction of advanced treated water to pipe loops

Introduction of advanced treated water to pipe loops

Introduction of advanced treated water to pipe loops shifted abundance of key organisms

Kennedy et al. (2023)
ESWRT

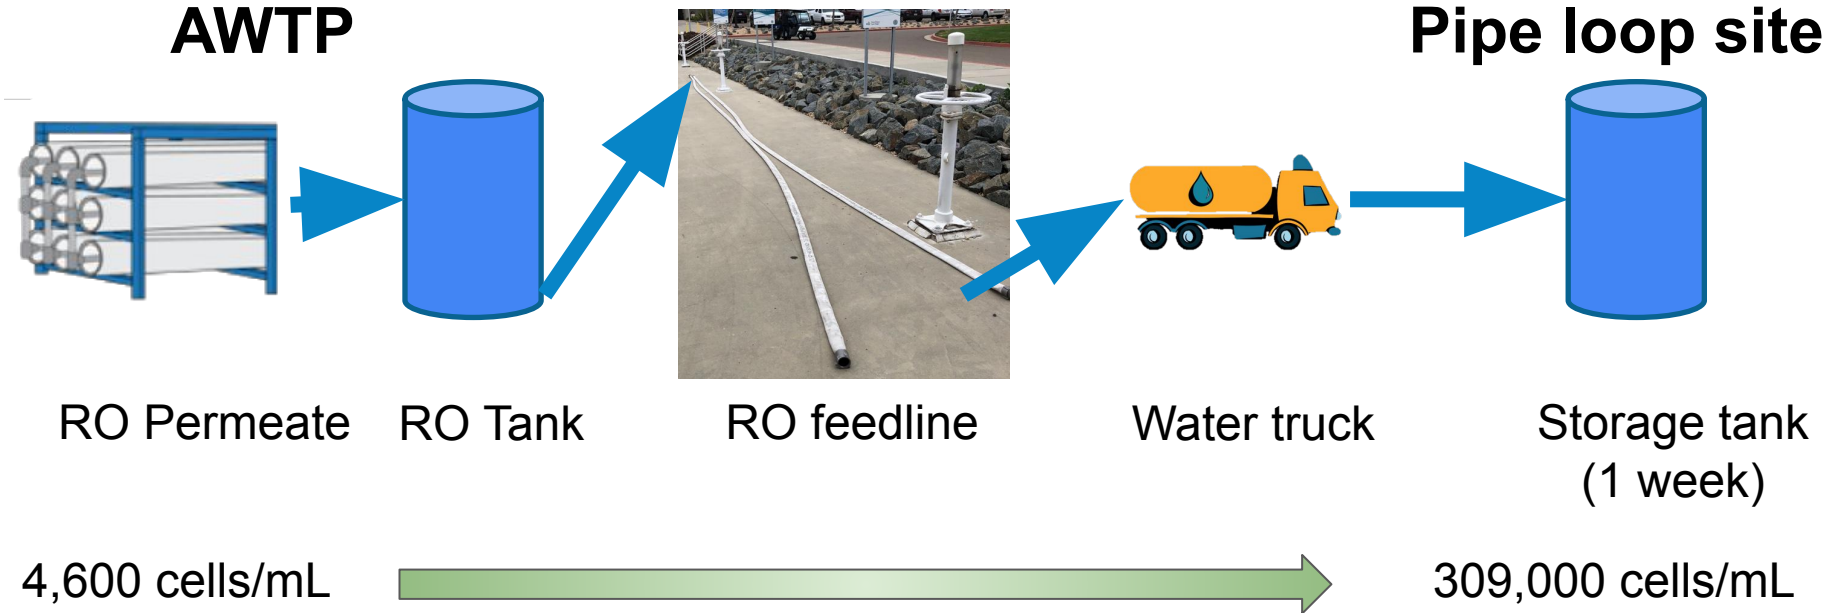

But...

Advanced treated water is influenced by storage / transport

Controlled inoculation of Advanced Treated Water: (work in progress)

See poster today!!

Alma Bartholow

Controlled inoculation of Advanced Treated Water

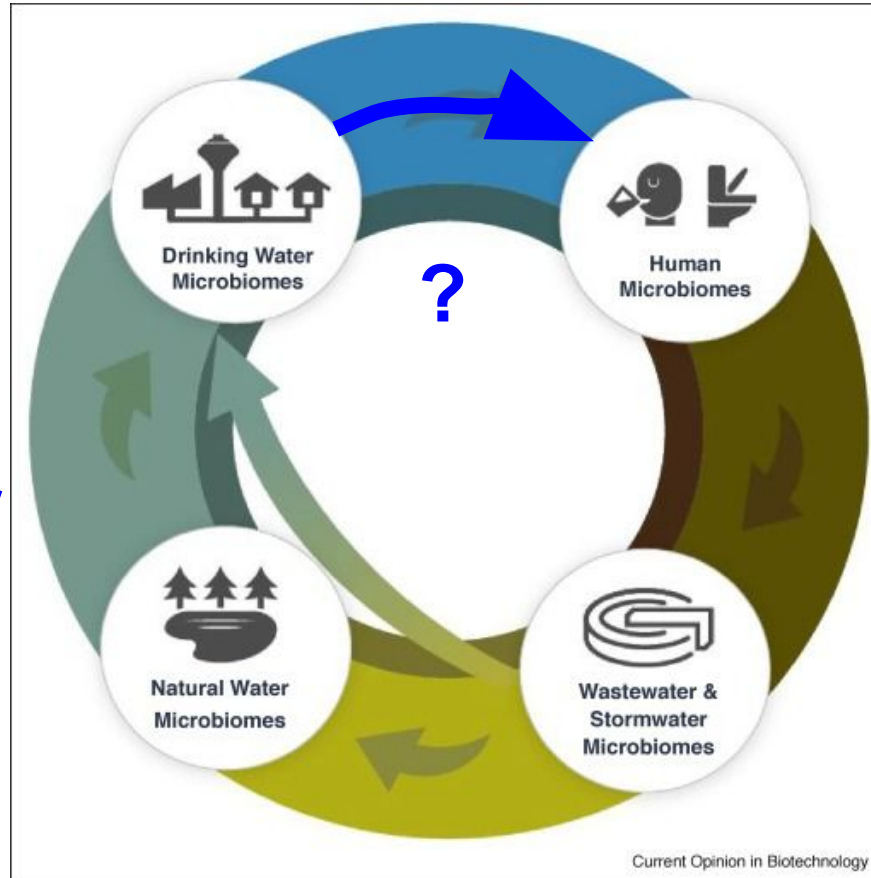

Controlled inoculation of Advanced Treated Water

How do changes in water systems affect microbial communities?

3. Drinking water distribution system

Raskin and Nielsen (2019)

Low water use in annular reactors: a pandemic experiment

Phase I

typical water usage

Phase II

reduced water usage

typical water age entering reactors

elevated water age entering reactors

Cell counts increased and chlorine decreased

Cell counts

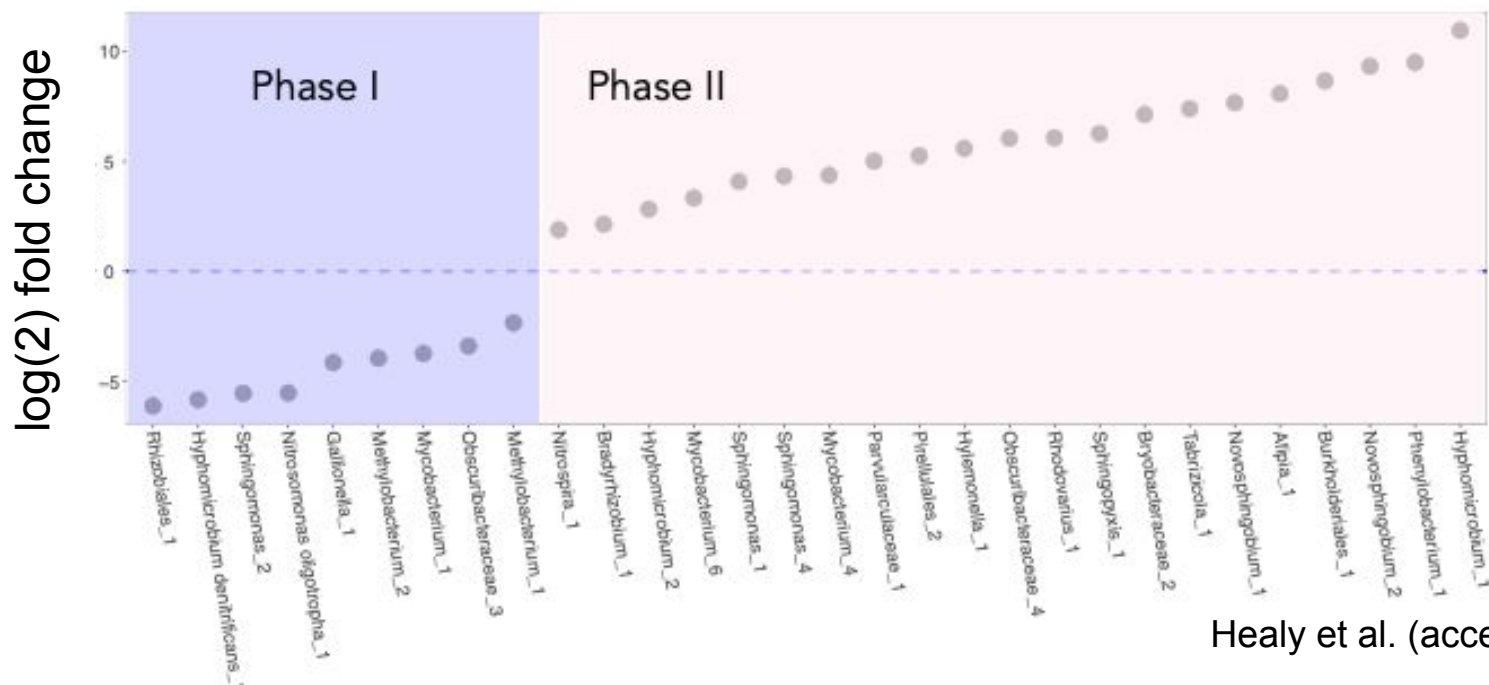

Total chlorine

*but each reactor behaved somewhat differently

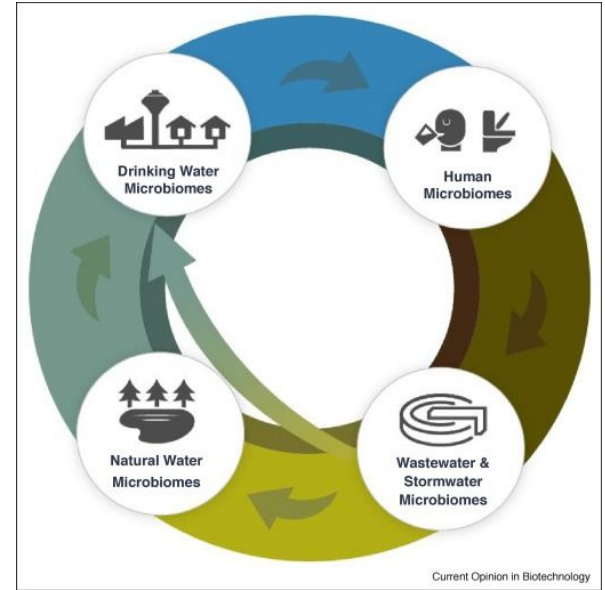

Community & functional changes with increased water age

Enrichment of functional genes related to the degradation of histidine, leucine, tyrosine, and pyrimidine

Key takeaways

1. Drinking water \neq sterile
2. Advanced treatment \rightarrow transformed microbial community
3. Pure water can be easily contaminated
 - a. Could controlled microbial inoculation increase stability?
4. Within distribution system, the water age affects the community

83 high quality metagenome-assembled genomes (MAGs) some enriched in reactor feed, bulk, or biofilm

Drinking water distribution system models

Pipe loops

Annular reactors

Questions about changes to water microbiomes

1. What happens as wastewater becomes drinking water:
advanced water treatment
2. What happens when advanced treated water enters a
distribution system: potable reuse
3. What happens when a distribution system experiences
low use/stagnation?
